

Professional Summary

Planning Analyst at Zepto (B.Tech, CSE – Data Science) building inventory analytics, automated projections and optimization workflows for nationwide supply chain planning, with a focus on **availability** and **inventory health**. Skilled in **SQL, Python, Databricks** and **visualisation tools**.

Academic Details

B.Tech, Computer Science & Engineering (Data Science)
Presidency University, Bangalore

Completed 2024
CGPA: 9.11 / 10

Experience

Manager II – Planning Analyst | Zepto (June 2025 - Present)

- **Delta Solve** drove a **3–4% increase in product availability** by identifying store stock gaps and recommending optimal replenishment allocations.
- Automated **brand projections** and inventory analytics pipelines reduced manual planning workload by **50%**.
- Scalable **inventory analytics pipelines** gave nationwide visibility into stock against consumption, helping drive MSL and availability.
- **Brand and loss analytics dashboards** quantified inventory loss against ideal benchmarks and surfaced availability gaps for action.
- **SSD Projection and tracking**, built on historical data, has been in use since the October cycle.
- **Open PO and warehouse capacity views** strengthened prioritisation, scheduling and execution monitoring.
- Close collaboration with cross-functional stakeholders resolved data issues and delivered timely, actionable insights.

Project Undertaken

Festive Tracking & Priority PO Inwarding

- Built complete **end-to-end festive tracking**, from the buying side through to the sell side.
- Fed a **priority PO list** into inwarding, ranking released POs using inventory position and consumption signals.
- Enabled faster inwarding decisions for high-impact POs, improving availability and reducing operational delays.

Inbound Capacity Utilisation

- Built a **real-time warehouse view** of inbound load versus available capacity.
- Helped planners spot bottlenecks early, improving inbound scheduling and reducing congestion risk.

Minimum Stock Level Workflow

- Developed an **ideal-inventory benchmarking framework** comparing current stock with expected consumption.
- Enabled proactive correction of overstock and understock, improving inventory health and planning efficiency.

Brand Projections Automation

- Built automated **brand-level projection pipelines** from historical trends and consumption patterns.
- Cut manual planning effort while improving projection accuracy and decision turnaround time.
- Developed an **RCA framework** to track under- and over-forecasting, giving clearer insight into forecast variance.

Delta Solve

- Built an **inventory optimization engine** that identifies stock gaps across customer-serving stores and evaluates whether warehouse inventory can fulfil them.
- Recommends optimal replenishment allocations and quantifies **recoverable demand**.
- Pinpoints operational bottlenecks that block replenishment, such as planning exclusions, inventory shortages, storage limits and transfer constraints, enabling data-driven action on availability.

University Chatbots

- Built a deep learning–based NLP chatbot trained on **3,000+ data points**, achieving **~95% accuracy** for student and parent queries.
- Improved user experience through intelligent query handling and a clean UI, reducing dependency on manual query resolution.

Trainings and Certifications

Data Analytics Essential - Cisco || BCG Data Science Virtual Experience Program - Forage || Databases and SQL for Data Science - Coursera

Skills and Proficiency
